INTERNATIONAL PRELIMINARY REPORT ON PATENTABILITY

International application No.

PCT/FI2004/000459

Box No. V Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement

1. Statement

atement			1000
Novelty (N)	Claims Claims	1-8	YES NO
Inventive step (IS)	Claims Claims	1-8	YES NO
Industrial applicability (IA)	Claims Claims	1-8	YES NO

2. Citations and explanations (Rule 70.7)

The claimed invention relates to a method and system for determining the content of a resistance mark and aims at solving the problems of prior art solutions such as that they are expensive, covers a large surface area, or needs a complicated reading device.

The solution to said problems provided by the application is to determine an absolute or relative value of one electrically conductive mark and convert the resistance value into information depicting the identity or properties of the item.

Reference is made to the following documents:

D1: US 5159181 A
D2: US 4355300 A
D3: US 5818019 A
D4: EP 0673103 A1

Document D1, which is considered to best represent the prior art, discloses a non-capacitive code reader for reading a code on an object. In one embodiment the reader can sense and analyze different ohmic resistances of a coded array (see column 5, line 65- column 6, line 19). The coded array may be written using conductive ink. D1 further discloses a reader for measuring the resistance of the mark arrangement without contact using alternating current measurement power.

Documents D2-D4 represents the general state of the art.

The subject matter of independent claim 1 differs from what is disclosed by document D1 in that only one resistive mark is

Supplemental Box

In case the space in any of the preceding boxes is not sufficient. Continuation of: Box V

used as opposed to the array of several elements used according to the arrangement described in document D1.

The technical effect of said difference is that the surface area on which to print the conductive mark can be small in size.

The problem solved by said difference can, thus, be seen as to provide a method for identifying the content of a resistance mark which does not require a large surface are.

None of the cited documents does neither disclose, nor hint at the solution of the independent claim 1 and 8, therefore, the subject matter of said claim is inventive (Article 33(3) PCT).

Claims 2-7 all include the features of independent claim 1 and the invention according to said claims is inventive.

The invention according to claims 1-8 is novel (N) and involves an inventive step (IS).

The invention according to claims 1-8 is industrially applicable (IA) (Article 33(4) PCT).

Claims:

11 6 -05- 2005

1. A method for identifying items, such as sheets of paper (7), or packages, or textiles, in which method

5

10

- a mark (6) made of electrically conductive material on the item (7) is read contactlessly with the aid of a measurement of alternating electricity, in order to identify the item (7), or determine its properties,

characterized in that

- the precise absolute or relative resistance value of one electrically conductive mark (6) is determined and the resistance value is converted, for example, with the aid of a coding table or calculation formula, into information depicting the identity or properties of the item.

15

2. A method according to Claim 1, <u>characterized</u> in that, in connection with the measurement, a reference mark is read, the resistance value of which is compared with the resistance value of the mark (6) depicting the properties or identity of the item.

20

3. A method according to Claim 2, <u>characterized</u> in that, in connection with the measurement, a reference mark, which consists of only electrode areas (2 and 3), is read.

25

4. A method according to any of the above Claims, <u>characterized</u> in that the measurement is implemented by feeding an electrical field to the conductive mark with the aid of a first pair of electrodes (4, 5) and measuring the resistance value of the conductive mark with the aid of a second pair of electrodes (2, 3).

30

- 5. A method according to any of the above Claims, <u>characterized</u> in that a conductive ink is used as the material of the conductive mark.
- 6. A method according to any of the above Claims, <u>characterized</u> in that a conductive polymer is used as the material of the conductive mark.

- 7. A method according to any of the above Claims, <u>characterized</u> in that part of the conductive mark is made by printing methods and part by output methods.
- 8. A reading system for a electrically conductive mark (6), which apparatus includes means for measuring impedance contactlessly,
 - the system includes means (10, 16, 17) for feeding alternating electricity measurement power contactlessly to one electrically conductive mark (6),
 - means (11) for determining a signal formed of the electrically conductive mark (6),

characterized in that

10

- means (12, 13, 14, 15) for determining the precise absolute or relative value of the resistance component of the single electrically conductive mark (6) from this signal, and

- means (15) for decoding the resistance value of the single electrically conductive mark (6) to form code information for the conductive mark (6).
